

## What are templates, inspections, and reports?

Learn about templates, inspections, and reports in SafetyCulture and how they relate to each other to help you create templates, conduct inspections, and share inspection reports.

## What are templates, inspections, and reports?

We are here to help, and you're at the right place to start your SafetyCulture experience. Understanding the relationship between templates, inspections, and reports is essential. They give you a seamless experience where you create templates, conduct inspections with the templates you've created, and share the completed inspection reports with your team members.

### Templates

Templates are the starting point of your SafetyCulture journey as they define how your inspections and reports will look. You can create templates from scratch with our intuitive Template Editor and utilize [questions](#), [sections](#), [logic fields](#), [different response types](#), an [approval page](#), and more to capture the necessary information. You can also [download templates from the Library](#), or [convert your existing Excel, images, and PDF forms into templates](#) in mere minutes.

### Inspections

Once you've finalized the templates, you're ready to [conduct inspections](#). Inspections are the processes you and your team use to capture data and populate inspection reports. In your work environment, conducting an inspection could be described as filling in a form, performing an audit, or going through a checklist. You can also require users to [submit an inspection for approval](#) and [create actions](#) to create follow-up tasks as you're walking through an inspection.

### Reports

Almost there! You're ready to [export completed inspections as PDF files and Word files](#) or [share web report links](#) with stakeholders. Not only do you get to share professional-looking reports, but you can also customize what kind of information is shown or hidden in your inspection reports and create email templates with [report layouts](#).

## Template response types

Learn about the different response types available on the title page and inspection page when creating a template.

Response types on a [template's title page](#) can only be used once, as they capture unique properties for inspections.

### Title page

Site

Inspection date

Person

Inspection location

Document number

Asset

Company

Auto-populating a title page response type won't work if it's in a [repeat section](#).

### Multiple choice responses

Custom response sets

This response type allows custom responses, where the following attributes can be edited for each response.

- [Response color](#)
- [Mark as flagged](#)
- [Response score](#)

Global Response Sets

[Global Response Sets](#) are stored at the organization level and can be used across multiple templates within an organization. Due to the unique nature, there are no customization options apart from adding, removing, and rearranging responses. Press to play GIF Press to play GIF

You can [link multiple choice responses](#) to automatically populate later questions with the response selected earlier.

- **Edit template:** Start editing the template.
- **Manage access:** Provide your team access to the template
- **View inspections:** View all inspections conducted with the particular template.
- **Duplicate template:** [Duplicate or copy the template](#) to use for a new template you may want to build.
- **Archive template:** [Archive and delete templates](#) you no longer need.
- **Bookmark or unbookmark:** [Bookmark the template](#) for easy access, or unbookmark it to remove it from your bookmarked list.
- **Download as PDF:** [Download your templates as PDF](#) to ensure you have a physical copy for record-keeping or for when you're in an area where devices aren't allowed.
- **Move to folder:** [Move templates to folders](#) for easy access, either by your frequency of usage or the type of work you're doing.

- **Share QR code:** [Share QR codes](#) for your team members to scan and start inspections easily on their mobile devices.

In a multiple choice question, you can use is one of to trigger the logic field for more than one specific answer. Or if you'd like the logic field to trigger regardless of the type of response, use is selected. Next, Look here to choose the response that triggers the logic field. Then click trigger to decide what should happen. requiring evidence such as PVRIG notes, notifying a user work group, or asking additional questions. For this example, if yes is selected, let's have the user add a photo by clicking required evidence. Leave media chat. Then click save and apply. Now let's look at adding logic if the answer during the inspection is no. Depending on the item's response time, you can add multiple logic fields to be triggered by different conditions. We'll start by getting further context with an additional question. Click add logic. Then click trigger. And select ask questions. Add your question and update the type of response. For this question, we'll use a custom multiple choice response set. Feel free to create your own by selecting responses. Let's ensure we create a follow-up task for this by requiring an action for either answer. Look at logic. Change is to is selected. Click trigger. Then select require action. Well done. If you'd like to test your logic fields, try it out in the mobile preview. Once you've made all your updates, click publish to share the changes with your team.

There are times when a particular response makes the rest of an inspection irrelevant. For example, when an early check produces a result that means no further questions need to be answered. With SafetyCulture, you can add a Skip to complete logic field to a question so that when a specific response is selected, all remaining content in the inspection is skipped immediately. Follow-up questions are not shown, including any approval steps.

## Examples

Ask different sets of questions based on the response to a question

When conducting a field safety assessment, you may want to ask follow-up questions based on the response. For example, if you answer "Yes" to the question "Was a hazard

observed?" the response can trigger additional hazard-related questions, ensuring a more focused and thorough inspection.

Ask a question in an inspection via the web app.

Notify a team member when a response is selected

You can set up automatic notifications to alert team members when their input is needed based on a specific response during an inspection. For example, if not all corrective actions in an inspection have been added as "Actions", a notification can be automatically sent to Area managers, informing them of the issue. This ensures key team members are alerted in real-time or after inspection completion for quick resolution of critical issues.

Complete an inspection when a response is selected

Skip unnecessary steps by configuring a question to trigger skip to complete when a specific response is selected. For example, if the question "Is the equipment in good working condition?" is answered "Yes," all remaining questions are skipped and the inspector can complete the inspection immediately, as no further follow-up is needed. This saves inspectors time and keeps inspections focused on what actually requires attention.

Skip to complete an inspection when a specific response is selected.

Require notes based on a response

Capture essential context by requiring a note when certain responses are selected. For example, if the question "Is the room clean and ready for guests?" is answered "No," the inspector must provide a note explaining which parts of the room are not ready and which areas still need cleaning. This helps document reasoning and ensures there is a clear justification before completing the inspection.

Require media evidence based on a response

Improve accuracy by requiring photos or videos when a specific response indicates an issue or needs confirmation. For example, if the question "Is the room clean and ready for guests?" is answered "Yes," the inspector must attach a photo showing the room's condition at the time of inspection. This ensures the reasoning behind the response is properly documented and provides clear justification before the inspection can be completed.

#### Require action based on a response

Use actions to ensure problems are followed up on and resolved. For example, during an inspection, if the answer to "Is the coffee machine working in order?" is "No," the inspector can be required to create an action to have the coffee machine fixed. This ensures failed checks lead to actionable tasks, helping teams track, assign, and complete necessary follow-up work before closing out the inspection.

### ***Logic conditions***

#### Multiple-choice

- If answer is <response>
- If answer is not <response>
- If answer is selected <response>
- If answer is not selected <response>
- If answer is one of <response>
- If answer is is not one of<response>

#### Person (Title page only)

- If answer is <text>
- If answer is not <text>

#### Document number (Title page only)

- If answer is <text>
- If answer is not <text>

#### Text answer

- If answer is <text>
- If answer is not <text>

#### Number (Number format)

- If answer is less than <number>
- If answer is less than or equal to <number>
- If answer is equal to <number>
- If answer is not equal to <number>
- If answer is greater than or equal to <number>
- If answer is greater than <number>
- If answer is between <number> and <number>
- If answer is not between <number> and <number>

#### Number (Temperature format)

- If temperature fails
- If temperature passes

#### Number (Calculation)

- If answer is less than <number>
- If answer is less than or equal to <number>
- If answer is equal to <number>
- If answer is not equal to <number>
- If answer is greater than or equal to <number>
- If answer is greater than <number>
- If answer is between <number> and <number>
- If answer is not between <number> and <number>

## Checkbox

- If checkbox is checked
- If checkbox is not checked

## Slider

- If slider value **less than** <value>
- If slider value **less than or equal to** <value>
- If slider value **equal to** <value>
- If slider value **not equal to** <value>
- If slider value **greater than or equal to** <value>
- If slider value **greater than** <value>
- If slider value **is between** <value> and <value>
- If slider value **is not between** <value> and <value>
